

Acknowledgements

We would like to thank Representative D. Wonda Johnson for her persistence – without her, this project would not have been possible. Also, at the Multicultural Alliance for a Safe Environment we would like to thank Susan Gordon for her support and patience. At the Southwest Research and Information Center, we would like to thank Chris Shuey and Paul Robinson for answering countless questions about historical and current issues involving uranium mining in New Mexico.

We owe a debt of gratitude to the more than 75 industry professionals, educators, community members, and government employees throughout the state who took time from their days to offer their insights and experiences of tackling uranium mine remediation issues in New Mexico. Our analysis is built on the foundational work each of these individuals has already put into understanding the complexities we face going forward.

At UNM BBER, this project was “all hands on deck,” with input from nearly every member of our team. In particular, we would like to thank Sofia Ximenez-Byrne for her determined and thoughtful work in helping us to understand the complexity of the cost data: the thousands of lines of coding and dozens of pages of assumptions were critical to this report, as was her detailed eye for revisions and edits. We’d like to also thank RaeAnn McKernan for the design, assembly, and copyediting of the document; every unformatted page handed to her came out beautifully for the final report. Julian Baca and Michael O’Donnell were instrumental in the analysis and discussions within the impact section.

We take full responsibility for any errors or oversights that may be contained within this report.
